

PRESENTS:

Digital Forensics, Social Media, the Internet, and Private Investigation

The term "digital forensics" is tossed around a lot today. But what does the term actually mean and how can you leverage digital information and computers to help you in your business? Learn what you can you extract from a personal computer on your own. Find out when you can do it yourself and when you should call-in a forensics professional. Gain insight into investigative "gotchas" and other key issues, such as the responsibilities of a "digital first responder," available tools and resources, best practices of data mining, social networking and privacy issues, and less conventional means of data gathering.

Guest Speaker: Mickey Lasky

Mr Lasky has over 10 years of information security experience with expertise in Incident Response, Digital Forensics, and Security Awareness. With time spent in large and mid-size corporate environments, the federal government, and higher education (both lecturing and supporting), Mickey has an extensive variety of knowledge that easily lends itself towards instructional and operational matters. He is currently the co-owner of HCP Forensics Services, a digital forensics company that provides fraud analysis services and web forensics services for Network Solutions. He holds several industry-recognized security certifications including Certified Ethical Hacker and SANS GIAC Certified Forensic Analyst (an ANSI/ISO/IEC 17024 Accredited Credential). He's been a registered PI for almost 10 years, and is a current member of the Private Investigators Association of Virginia.
